### 2-in-1 PFC and Inverter Intelligent Power Module (IPM), 600 V, 10 A

The NFCS1060L3TT is a fully-integrated PFC and inverter power stage consisting of a high-voltage driver, six motor drive IGBT's, one PFC SJ-MOSFET, one PFC SiC-SBD for rectifier and a thermistor, suitable for driving permanent magnet synchronous (PMSM) motors, brushless-DC (BLDC) motors and AC asynchronous motors.

The IGBT's are configured in a 3-phase bridge with separate emitter connections for the lower legs for maximum flexibility in the choice of control algorithm.

An internal comparator and reference connected to the over-current protection circuit allows the designer to set individual over-current protection levels for the PFC and the inverter stages. Additionally, the power stage has a full range of protection functions including cross-conduction protection, external shutdown and under-voltage lockout functions.

### **Features**

- Simple Thermal Design with PFC and Inverter Stage in One Package
- Cross-Conduction Protection
- Integrated Bootstrap Diodes and Resistors
- UL1557 Certification (File Number: E339285)

### **Typical Applications**

- Heat Pumps
- Home Appliances
- Industrial Fans
- Industrial Pumps

**Table 1. PIN FUNCTION DESCRIPTION** 

Pin	Name	Description
1	Х	X Phase MOSFET Drain for PFC Inductor Connection
4	VB(W)	High–Side Bias Voltage for W Phase IGBT Driving
5	W	Output for W Phase and High-Side Bias Voltage GND for W Phase IGBT Driving
8	VB(V)	High-Side Bias Voltage for V Phase IGBT Driving
9	V	Output for V Phase and High-Side Bias Voltage GND for V Phase IGBT Driving
12	VB(U)	High-Side Bias Voltage for U Phase IGBT Driving
13	U	Output for U Phase and High-Side Bias Voltage GND for U Phase IGBT Driving
16	Р	Positive DC-Link Input / Positive PFC Output Voltage
19	NX	X Phase MOSFET Source for PFC
20	NW	Negative DC-Link Input for W Phase
21	NV	Negative DC-Link Input for V Phase
22	NU	Negative DC-Link Input for U Phase
23	HIN(U)	Signal Input for High-Side U Phase
24	HIN(V)	Signal Input for High-Side V Phase
25	HIN(W)	Signal Input for High-Side W Phase
26	LIN(U)	Signal Input for Low–Side U Phase
27	LIN(V)	Signal Input for Low-Side V Phase
28	LIN(W)	Signal Input for Low–Side W Phase
29	IN(X)	Signal Input for PFC X Phase
30	FLTEN	Fault Output / Enable
31	ITRIP(P)	Input for Current Protection for PFC
32	ITRIP(I)	Input for Current Protection for Inverter
33	TH	Thermistor Bias Voltage
34	VDD	Low-Side Bias Voltage for IC and IGBTs Driving
35	VSS	Low-Side Common Supply Ground

NOTE: Pins 2, 3, 6, 7, 10, 11, 14, 15, 17 and 18 are not present.

### **APPLICATIONS INFORMATION**

### **Input / Output Timing Chart**

### NOTES:

- 1. This section of the timing diagram shows the effect of cross-conduction prevention.
- 2. This section of the timing diagram shows that when the voltage on VDD decreases sufficiently all gate output signals will go low, switching off all six IGBTs and PFC MOSFET. When the voltage on VDD rises sufficiently, normal operation will resume.
- 3. This section shows that when the bootstrap voltage on VBS drops, the corresponding high side output U (V, W) is switched off. When the voltage on VBS rises sufficiently, normal operation will resume.
- 4. This section shows that when the voltage on ITRIP(I) exceeds the threshold, all IGBTs and PFC MOSFET are turned off. Normal operation resumes later after the over–current condition is removed. Similarly, when the voltage on ITRIP(P) exceeds the threshold, all IGBTs and PFC MOSFET are turned off. Normal operation resumes later after the over–current condition is removed
- 5. After VDD has risen above the threshold to enable normal operation, the driver waits to receive an input signal on the LIN input before enabling the driver for the HIN signal.

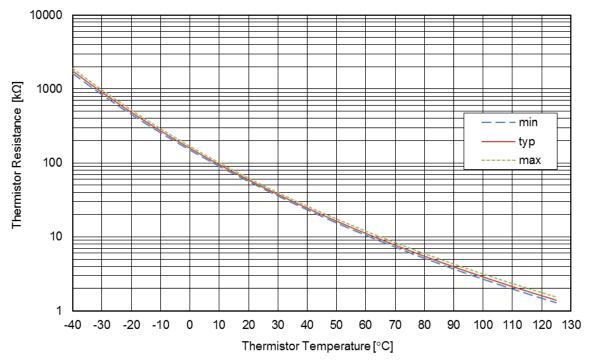

Figure 21. Thermistor Resistance – Thermistor Temperature

### **Signal Inputs**

Each signal input has a pull–down resistor internally. An additional pull–down resistor of between 2.2 k $\Omega$  and 3.3 k $\Omega$  is recommended on each input to improve noise immunity.

### **FLTEN** pin

The FLTEN pin is connected internally to an open–drain FAULT output and an ENABLE input requiring a pull–up resistor. If the pull–up voltage is 5 V, use a pull–up resistor with a value of 6.8 k $\Omega$  or higher. If the pull–up voltage is 15 V, use a pull–up resistor with a value of 20 k $\Omega$  or higher. The pulled up voltage in normal operation for the FLTEN pin should be above 2.5 V, noting that it is connected to an internal ENABLE input. The FAULT output is triggered if there is a VDD under–voltage or an overcurrent condition on either the PFC or inverter stages.

Driving the FLTEN terminal pin is used to enable or shut down the built—in driver. If the voltage on the FLTEN pin rises above the positive going FLTEN threshold, the output drivers are enabled. If the voltage on the FLTEN pin falls below the negative going FLTEN threshold, the drivers are disabled.

### **Under-voltage Protection**

If VDD goes below the VDD supply undervoltage lockout falling threshold, the FAULT output is switched on. The FAULT output stays on until VDD rises above the VDD supply under-voltage lockout rising threshold. The hysteresis is approximately 200 mV.

### **Overcurrent Protection**

An over–current condition is detected if the voltage on the ITRIP(I) or ITRIP(P) pins are exceed the reference voltage (Refer to Table 6 – Input / Output Logic Table). There is a blanking time of typically 350 ns to improve noise immunity. After a shutdown propagation delay of typically 0.6  $\mu$ s, the FAULT output is switched on.

The over–current protection threshold should be set to be equal or lower to 2 times the module rated current (Io).

An additional fuse is recommended to protect against system level or abnormal over-current fault conditions.

### Capacitors on High Voltage and VDD supplies

Both the high voltage and VDD supplies require an electrolytic capacitor and an additional high frequency capacitor. The recommended value of the high frequency capacitor is between 100 nF and 10  $\mu$ F.

### **Minimum Input Pulse Width**

When input pulse width is less than 1 µs, an output may not react to the pulse. (Both ON signal and OFF signal)

### **Calculation of Bootstrap Capacitor Value**

The bootstrap capacitor value CB is calculated using the following approach. The following parameters influence the choice of bootstrap capacitor:

- VBS: Bootstrap power supply. 15 V is recommended.
- QG: Total gate charge of IGBT at VBS = 15 V.
   12.7 nC
- UVLO: Falling threshold for UVLO.
   Specified as 12 V.
- IDMAX: High side drive power dissipation. Specified as 0.4 mA
- TONMAX: Maximum ON pulse width of high side IGBT.

Capacitance calculation formula:

$$CB = (QG + IDMAX * TONMAX)/(VBS - UVLO)$$

CB is recommended to be approximately 3 times the value calculated above. The recommended value of CB is in the range of 1 to 47  $\mu$ F, however, the value needs to be verified prior to production. When not using the bootstrap circuit, each high side driver power supply requires an external independent power supply.

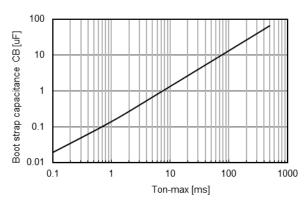

Figure 22. Bootstrap Capacitance versus Ton-max

### **Table 8. MOUNTING INSTRUCTIONS**

Item	Recommended Condition
Pitch	$56.0 \pm 0.1$ mm (Please refer to MECHANICAL CASE OUTLINE)
Screw	Diameter : M3 Screw head types: pan head, truss head, binding head
Washer	Plane washer The size is D: 7 mm, d: 3.2 mm and t: 0.5 mm JIS B 1256
Heat sink	Material: Aluminum or Copper Warpage (the surface that contacts IPM ) : –50 to 100 μm Screw holes must be countersunk. No contamination on the heat sink surface that contacts IPM.
Torque	Temporary tightening: 20 to 30 % of final tightening on first screw Temporary tightening: 20 to 30 % of final tightening on second screw Final tightening: 0.6 to 0.9 Nm on first screw Final tightening: 0.6 to 0.9 Nm on second screw
Grease	Silicone grease.  Thickness: 100 to 200   Uniformly apply silicone grease to whole back.  Thermal foils are only recommended after careful evaluation. Thickness, stiffness and compressibility parameters have a strong influence on performance.

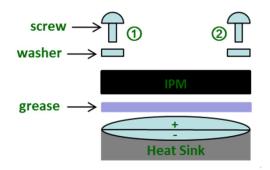

Figure 23. Mount IPM on a Heat Sink

Figure 24. Size of Washer

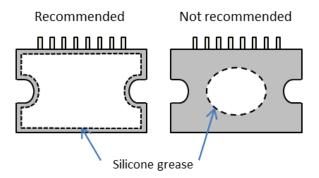

Figure 25. Uniform Application of Grease Recommended

### Steps to mount an IPM on a heat sink

1st: Temporarily tighten maintaining a left/right balance.

2<sup>nd</sup>: Finally tighten maintaining a left/right balance.
